Name: Chauhan Sumit K.

Dept: Data engineering

Tasks:

Objective:

The objective of this assignment is to help you understand how Azure Functions work using a simple HTTP trigger. You will create and test a serverless function that responds to user input.

Problem Statement:

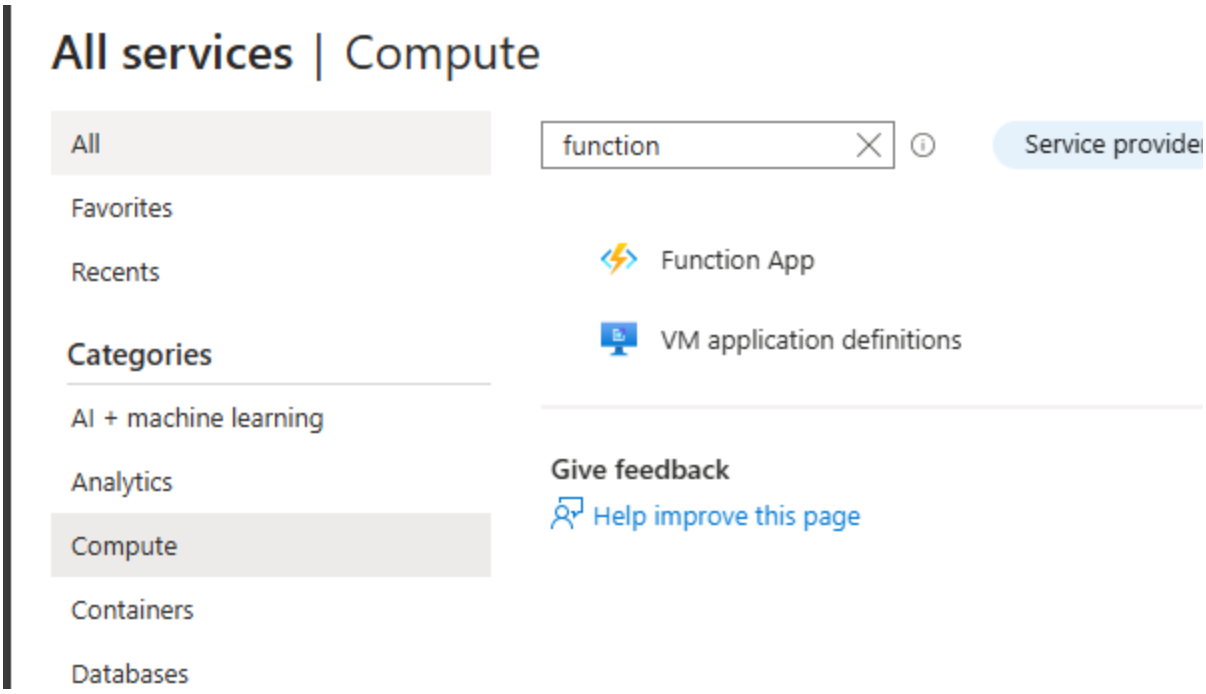
Create a **simple Azure HTTP-triggered Function** that accepts a parameter called `name` as input and returns a greeting message.

Requirements:

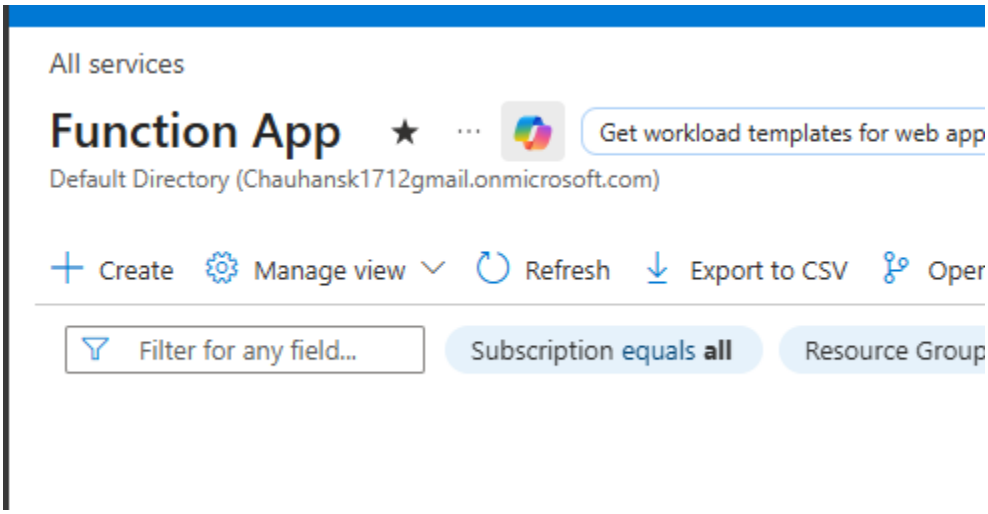
- If `name` is provided, return:
  `Hello <name>, welcome to Azure Functions!`
- If `name` is not provided, return a default message asking the user to provide a name.
- The function must return a successful HTTP response.
- Test the function using a web browser.

Firstly go to all services in azure portal

Go to compute and search for **Function apps**



Click on create



Choose consumption plan and confirm

All services › Function App

Create Function App

Select a hosting option

These options determine how your app scales, resources available per instance, and pricing. Learn more about Functions hosting options

Hosting plans	Flex Consumption Get high scalability with compute choices, virtual networking, and pay-as-you-go billing.	Functions Premium Deploy multiple function apps on the same plan with event-driven scaling.	App Service Run web apps and function apps on the same plan with more compute choices and pay for the instances of the plan.	Container Apps environment Host function apps with other containerized microservices and pay for compute capacity.	Consumption Pay for compute resources when your functions are running (pay-as-you-go).
Scale to zero	✓	-	-	✓	✓
Scale behavior	Fast event-driven	Event-driven	Metrics based	Event-driven with KEDA	Event-driven
Virtual networking	✓	✓	✓	✓	-
Dedicated compute and prevent cold start	Optional with Always Ready	Minimum of 1 instance required	Minimum of 1 instance required	Optional with minimum replicas	-
Max scale out (instances)	1000	100	30	300	200

Create Function App (Consumption)

Basics | Storage | Networking | Monitoring | Durable Functions | Deployment | Authentication | Tags | Review + crea

Create a function app, which lets you group functions as a logical unit for easier management, deployment and sharing of resources. Functions lets you execute your code in a serverless environment without having to first create a VM or publish a web application.

Project Details

Select a subscription to manage deployed resources and costs. Use resource groups like folders to organize and manage all your resources.

Subscription * : Azure for Students

Resource Group * : (New) rsg-function-app-demo

Create new

Instance Details

Function App name * : az-function-http

-eebqh6bgdkcef8a7.centralindia-01.azurewebsites.net

Secure unique default hostname on. More about this update

Operating System * : Linux (legacy) / Windows

Flex Consumption is now the recommended serverless hosting plan for Azure Functions. Learn more.

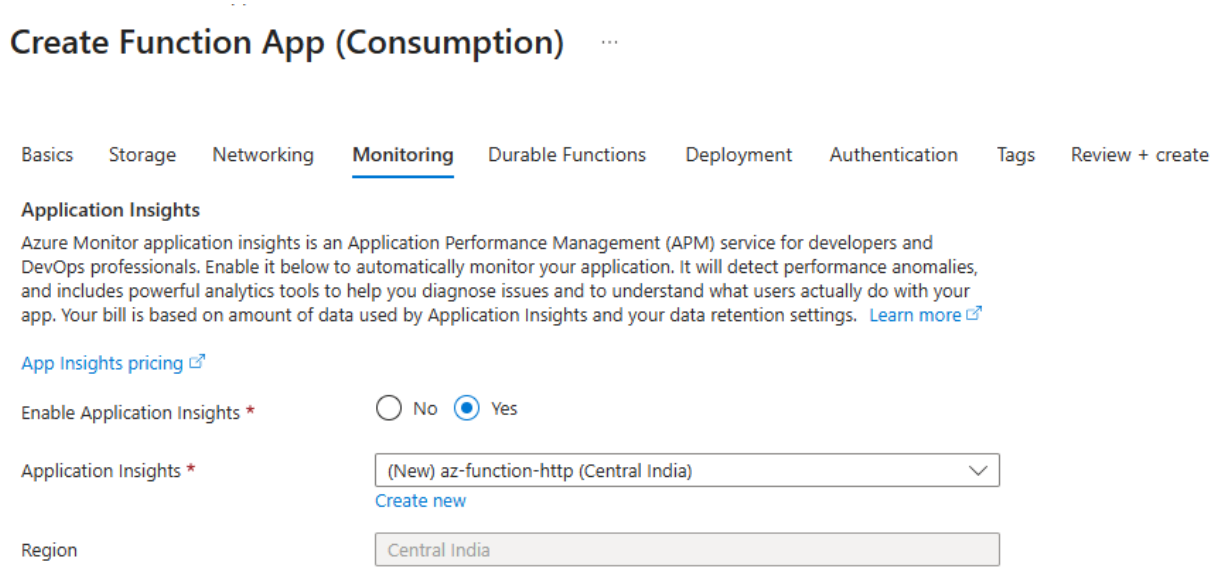
Runtime stack * : Node.js

Version * : 22 LTS

Region * : Central India

Review + create | < Previous | Next : Storage >

Here we have chose node.js as we are dealing with Http triggers and APIs



Review and create

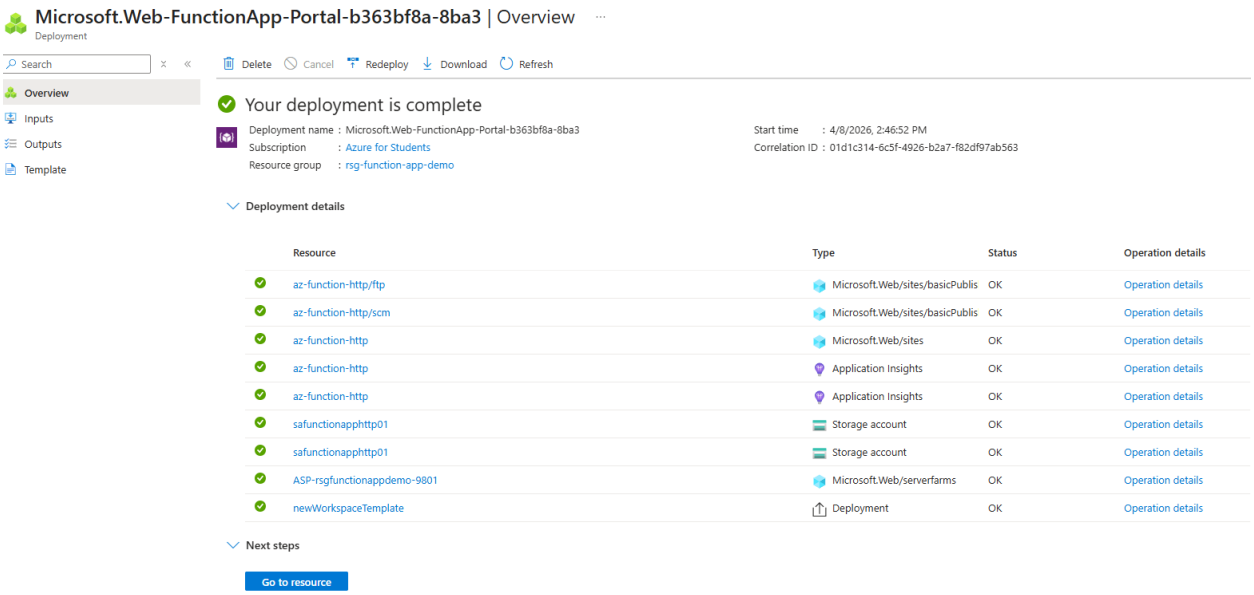
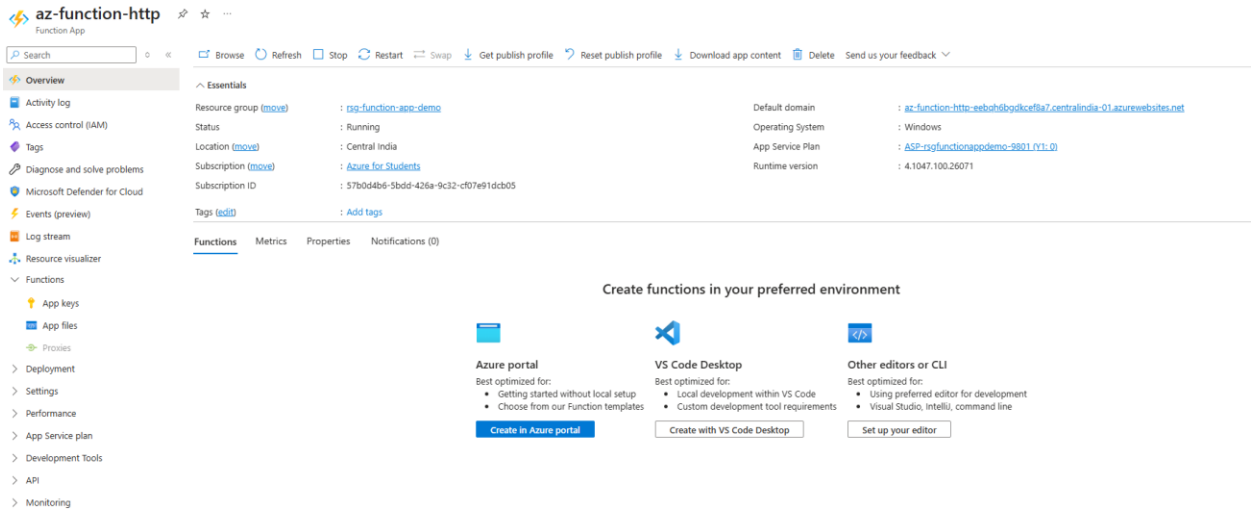
Create | < Previous | Next > | Download a template for automation



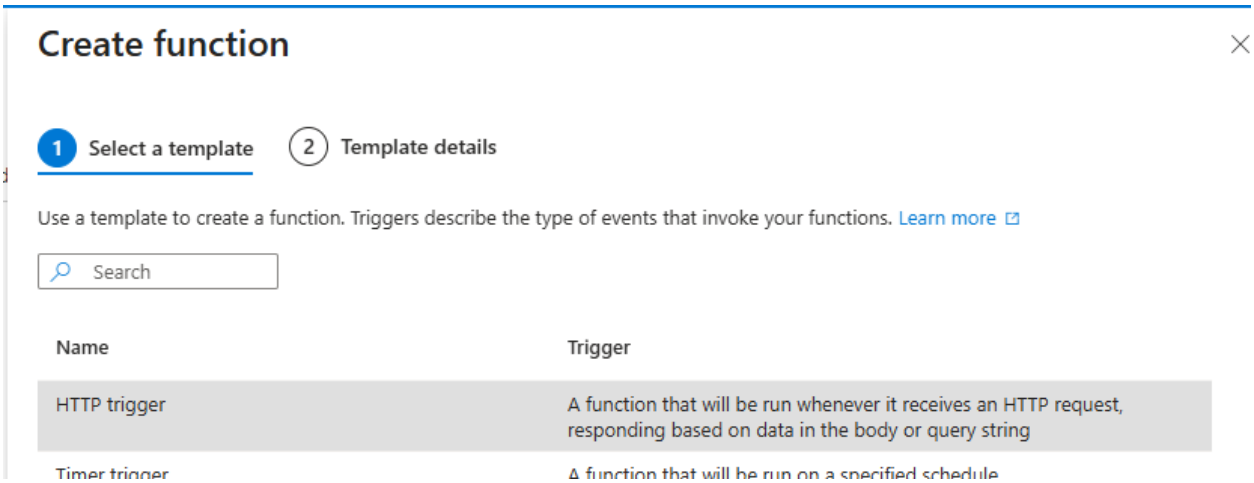
Open your function app:

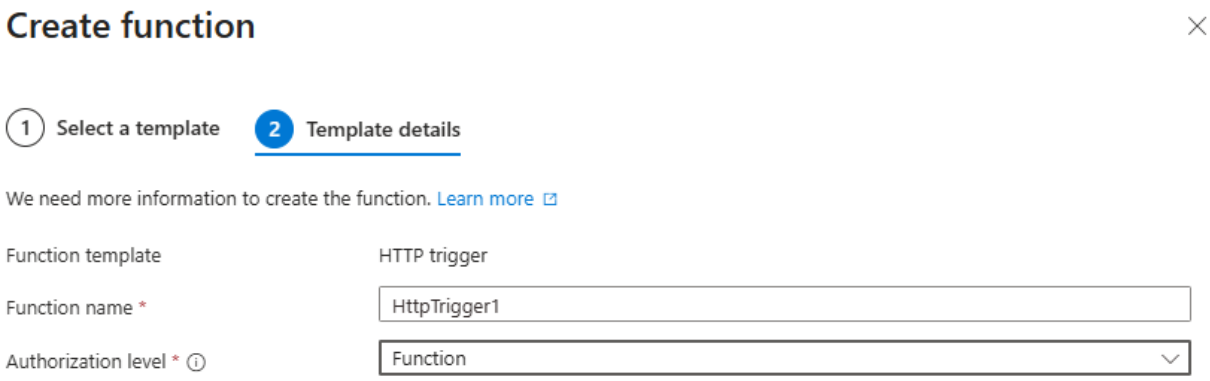


There are 3 ways given to create function

Choose azure portal

On right panel, choose http trigger





After hitting on create

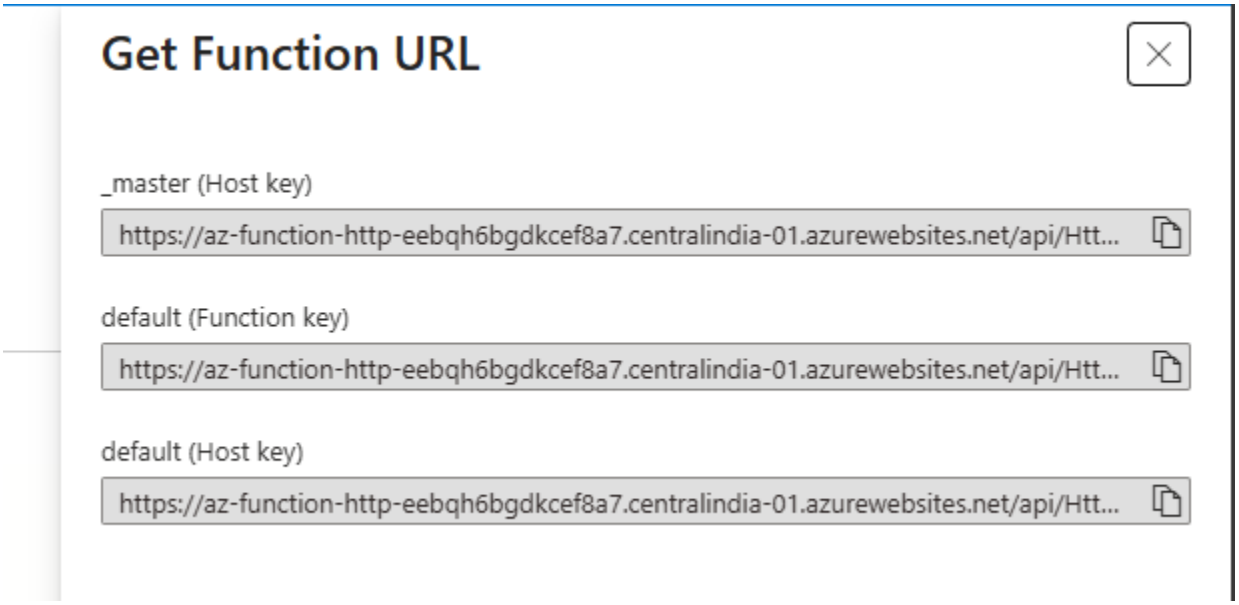
You will get some boilerplate code that you can directly use it or change it

You can add status: 200 in response but default is 200

Save changes

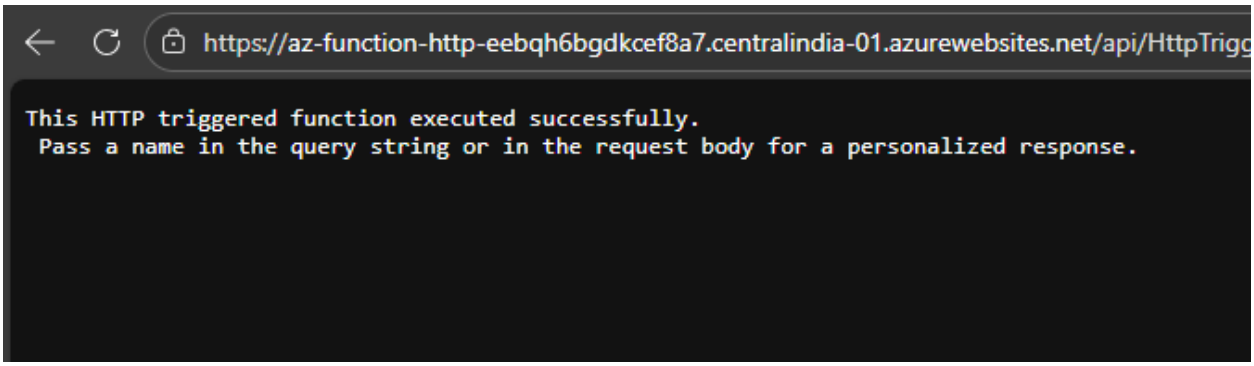
Click on Get function URL

On right panel:

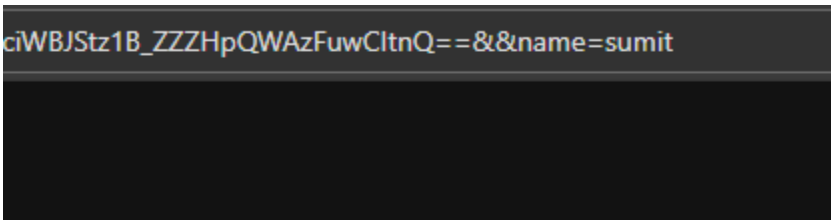


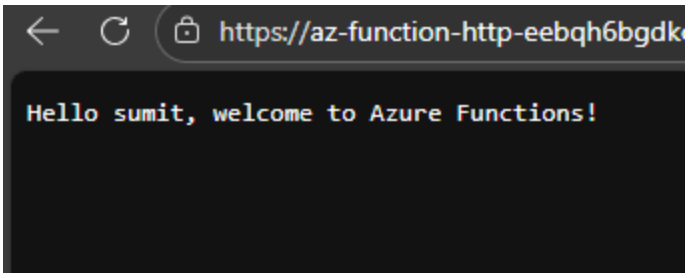
For testing use default Function key

Paste on your browser



If you pass query parameter at the end of function url





https://az-function-http-eebqh6bgdk
Hello sumit, welcome to Azure Functions!
